This recipe shows how to create a new Android project.

Recipe

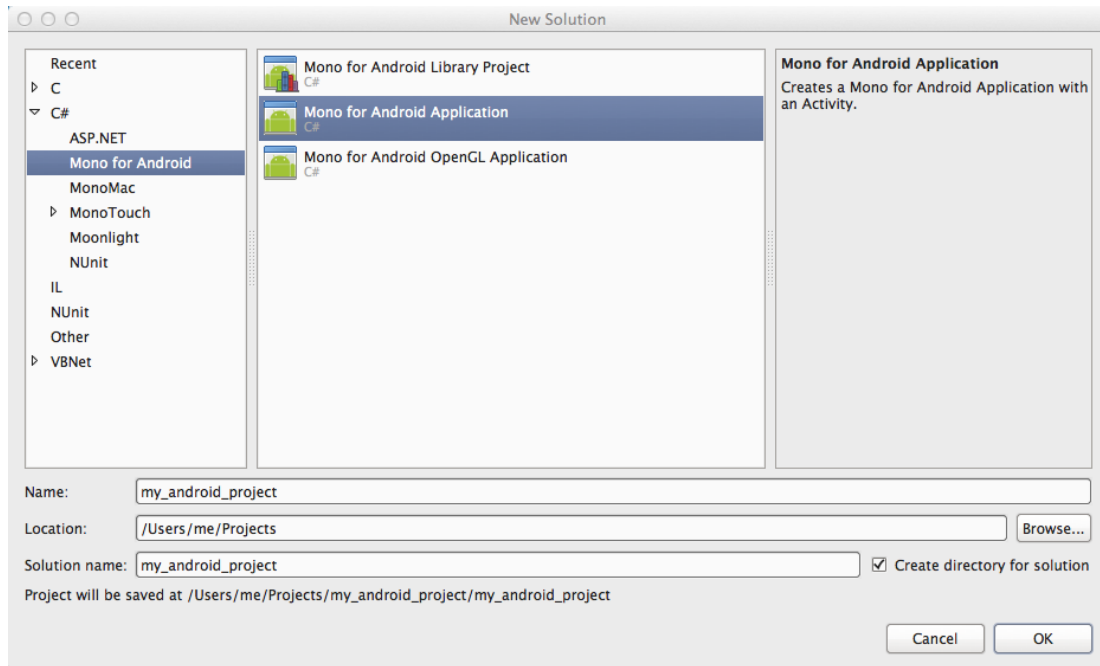

Create an Android Project in MonoDevelop

Creating a new Android project in MonoDevelop is simple.

1. First, launch MonoDevelop and click on "Start New Solution" in the top left corner.

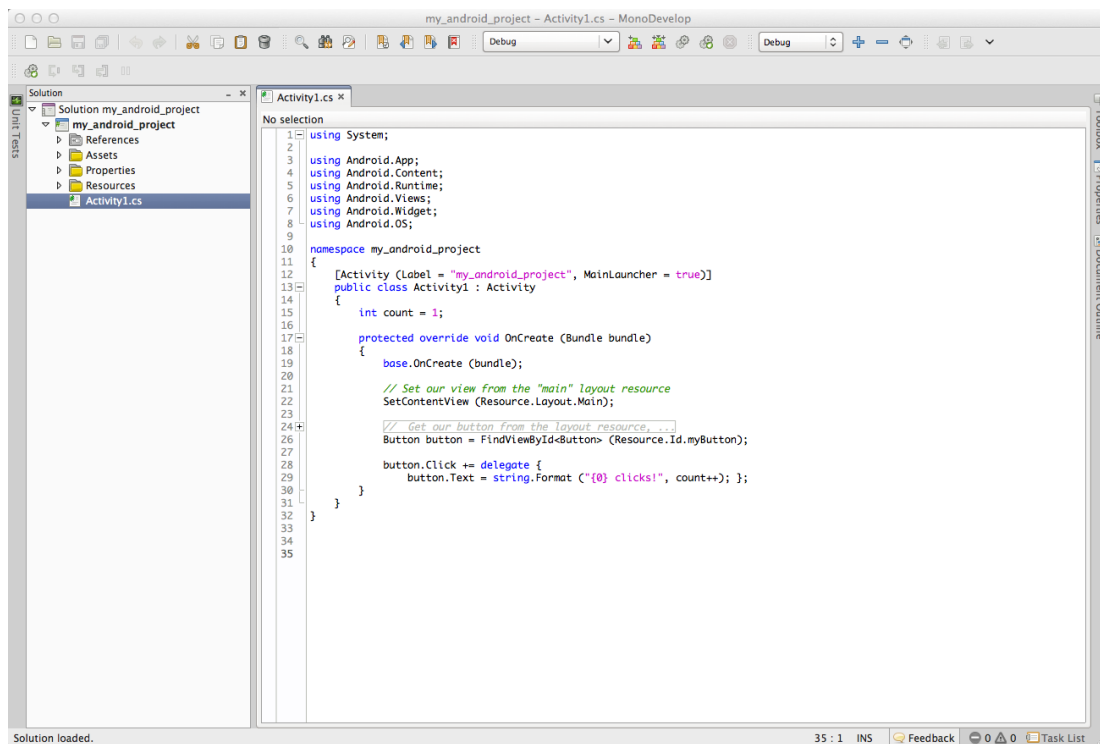

2. A window will pop up with a list of options for the types of projects available to you. To create an Android project, hit the C# category to open up the available sub-categories, then select Mono For Android.

3. On the right, you will see options for the various templates available to you. If you are new to Mono For Android and unsure about which one to use, just select Mono For Android Application.

4. Choose a sensible name for your project, avoiding spaces and special characters, and hit OK.

5. MonoDevelop will create and populate a new project for you.
